IMPLICATED IN A MULTITUDE OF PHYSIOLOGIC AND PATHOLOGIC PACCTOR. IMPLICATED IN A MULTITUDE OF PHYSIOLOGIC AND PATHOLOGIC PACCTOR. IMPLICATED IN A MULTITUDE OF PHYSIOLOGIC AND PATHOLOGIC PACCTOR. IMPLICATED IN ANGIGGENESIS, WOUND HEALING, AND TUMOR GROWTH. POTTENT MITOGEN AND CHEMOATTERACTANT FOR MESENCHYME-DERLYED CELLS. IMPLICATED IN THE DIFFERENTIATION, PROLIFERATION, AND MAINTENANCE OF CELLS IN THE CENTRAL MERVOUS SYSTEM AND IN BONE FORMATION. MAJOR ANGIGGENIC FACTOR THAT ALSO ACTIVATES THORR MEGOVASCULARIZATION (BY SIMILARITY).

1- SUBUNIT: FORMS A QUATERNARY COMPLEX WITH TWO FGER1 AND AT LEAST ONE HEPARAN SULFATE (BY SIMILARITY).

1- ALTERNATIVE PRODUCTS: AT LEAST TWO ISOFORMS; 18 KDA AND 25 KDA (SHOWN HERE); MAY BE PRODUCED BY USE OF ALTERNATIVE TRANSLATION INTELLIBED. BOTH FORMS ARE ACTIVE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           InterPro; IPR002209; HBGF_FGF

"The role bpgf in canine Hemangiosarcoma.";

RI Submitted (APR-1998) to the EMBL/GenBank/DDBJ databases.

CC --- FUNCTION: WIDE-SPECTRUM MITOGENIC, ANGIOGENIC, AND NEUROTROPHIC CC PACTOR. IMPLICATED IN A MULTIFUED OF PHYSIOLOGIC AND PATHOLOGIC CC PROCESSES, INCLUDING LIMB DEVELOPMENT, ANGIOGENESIS, WOUND CC PROLIFERATION, AND TUMOR GROWTH. POTENT MITOGEN AND CHEMOATTRACTANT FOR MESENCHYME-DERIVED CELLS. IMPLICATED IN THE DIFFERNTIATION, CC PROLIFERATION, AND MAINTENANCE OF CELLS IN THE CENTRAL NERVOUS SYSTEM AND IN BONE FORMATION. MAJOR ANGIOGENIC FACTOR THAT ALSO CC SYSTEM AND IN BONE FORMATION. MAJOR ANGIOGENIC FACTOR THAT ALSO CC --- SUBUNIT: FORMS A QUATERNARY COMPLEX WITH TWO FGERI AND AT LEAST CC --- SUBUNIT: FORMS A QUATERNARY COMPLEX WITH TWO FGERI AND AT LEAST CC --- SIMILARITY: BELONGS TO THE HEPARIN-BINDING GROWTH FACTORS FAMILY. DR HSSP; P09038; 1BFF.

Cys 69 and Cys 87) derivatised with an agent able to form a covalent s-C bond with Cys. Typical agents include iodoacetic acid, haloacetamide, alkali tetrathionates, alkyl methanethiosulphones and 1-6C alkylsulphones. The derivatised bFGF is used to accelerate the healing of wounds (including burns, ulcers, transplants, and bone grafts), to revascularise ischaemic tissue or to regenerate damaged neural tissue. Compared with native bFGF the recombinant derivatised bFGF has better biological activity and stability (esp. not aggragating by dimer formation) and is also easier to isolate.
                                                                                               Novel unit dose comprising fibroblast growth factor, its angiogenically active fragment or mutein for inducing cardiac angiogenesis, treating coronary artery disease and reducing post myocardial infarction injury

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        given in the specification, its anylogenically active fragment or mutein. The product of the invention has angiogenic and cardiant activity. (I) is used for treating a human patient for coronary artery disease, and inducing angiogenesis in the human heart. (I) further provides an adjunct for reducing post myocardial infarction injury in humans. The unit dose provides the human patient with a rapid and therapeutic cardiac angiogenesis sufficient to obviate surgical therapeutic cardiac angiogenesis sufficient to obviate surgical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (VII), 20 given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       intervention and results in an superior increase in the treated patients's exercise tolerance time (ETT). It also provides a safe and therapeutically efficacious treatment for the patients with coronary artery disease that lasts at least 6 months before a further treatment is needed. The method provides superior increase of 1.5-2 minutes in the treated patient's (ETT), compared to an increase of 30 seconds for current modes treatment. This sequence represents the human FGF-2 protes fragment described in the method of the invention.
Treating or preventing erectile dysfunction, c growth factor, particularly fibroblast growth in the penis, groin or leg -
                                                                                                                                                                                                                      09-MAR-2001;

      The present invention describes a method of preventing or treating neuronal damage following a central nervous system insult, involving modulating the cerebral temperature and administering a neurologic therapeutic agent. The agent may be a growth factor, such as fibroble growth factor (FGF), The method is growth factor (FGF) or insulin-like growth factor (FGF). The method is growth factor (FGF) or insulin-like growth factor (FGF).
                                                                                                     Preventing or treating neuronal damage of the central nervous system, comprises modulating the cerebral temperature and administering a neurological therapeutic agent \, -
                                                                                                                                                       WPI;

The peptide sequence was deduced from the synthetic DNA sequence prepd. as described in EP-363675. E. coli cells transformed with the synthetic DNA were lysed and the supernatent purified, giving a 50:50 mixture of a 154 residue bFGF (2-155) having the amino acid sequence of the 155 residue form (Abraham et al., Science, 233, 545-548, 1986) but without the N-terminal Met; and a 153 residue bFGF (3-155). An adduct of bFGF formed with heparin or heperan sulphate contg. the bFGF 9-10 Leu-Pro bond can be cleaved with pepsin A or cathepsin D to cleave this bond and release a peptide with the N-terminus be deleted up to and including residue 9, sequentially, giving a protein of X-bFGF(9-155), where X is any peptide from regidues 1-9 of bFGF sequentially. This cleavage method can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               disease.

                                      This is a basic fibroblast growth factor (bFGF) of human origin. It is used in a compsn. to treat periodontal disease. The compsn. promotes regeneration ne-attachment of the bone of the tooth socket, the periodontal membrane and the cementum and regeneration of dentine. The bFGF may be prepd. by recombinant methods, and is pref. formulated in a gel for application to the affected area.

                                                                                                                         This is a basic fibroblast growth factor (bFGF) of human origin. It is used in a compsn. to treat periodontal disease. The compsn. promotes regeneration an re-attachment of the bone of the tooth socket, the periodontal membrane and the cementum and regeneration of dentine. The bFGF may be prepd. by recombinant methods, and is pref. formulated in a gel for application to the affected area.

                                                                           DNA encoding the sequence may be mutated to encode an analogue, of human basic fibroblast growth factor (bFGF) bFGF-C78/96S, which has reduced affinity for heparin. One or more positively-charged AAs in the heparin-binding domain (AAs 128-138) are replaced by neutral or negatively-charged residues as indicated in the feature table. A recombinant vector (pUC9-TSF11 or pUC9delH3-pTSF-3) contg. the mutated DNA can be used to transform bacterial or mammalian host cells for prodn. of the analogue.

```
The peptide sequence was deduced from the synthetic DNA sequence prepd. as described in EP-363875. E. coll cells transformed with the synthetic DNA were lysed and the supernatent purified, giving a 50:50 mixture of a 154 residue bFGF (2-155) having the amino acid sequence of the 155 residue form (Abraham et al., Science, 233, 545-548, 1986) shown here but without the N-terminal Met; and a 153 residue bFGF (3-155). An adduct of bFGF formed with heparin or heperan sulphate contg. the bFGF 9-10 Leu-Pro bond can be cleaved with pepsin A or cathepsin D to cleave this bond and release a peptide with the N-terminus be deleted up to and including residue 9, sequentially. This cleavage method can be used to obtain a pure form of the 146 amino acid bFGF (10-155) bFGF. The prod. can be used to treat wounds and hourse

These fusion peptides may be used for anti-aging cosmetics and in wound healing after surgery.

                                                                                                                                                                                                                                                                                                                 The sequences given in AAR53270-71 represent recombinant chimeric basic fibroblast growth factors (bFGF). These proteins comprise a basic FGF having 155 amino acids in which Ala3 and Ser5 have been replaced by CG Glu, and opt. Cys78 and Cys96 are replaced by Lys, Asp, Glu, Asn, Gln, His, Ile, Leu, Val, Phe, Tyr, Met, Thr, Pro, Ala, Gly, Arg, or Trp, pref. Ser. The glu3,5 FGF has the mitogenic properties of tissue derived bFGF, but expression in E. coli is significantly greater than the native sequence, allowing high yield production of the bFGF. Replacing Cys78 and Cys96 by Ser causes stabilisation of the growth factor by eliminating thio-disulphide interchange. This facilitates the purification and enhances the stability of the isolated protein. The bFGF have therapeutic applications for healing burns, surgical inclsions and other wounds, for treating skin ulcers including bed sores, for cardiovascular conditions and restarting blood flow after heart attacks by revascularising the damaged tissue, for enhancing bone repair and treating musculoskeletal injuries, and in neuro-

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
